

Australasian (iron and steel) Slag Association Inc.

Membership Annual Survey Results

January to December 2015

Prepared by
HBM Group Pty Ltd

Ed: 1	Australasian (iron & steel) Slag Association Incorporated	Page: 1 of 4
Date: June, 2016		ASA_survey_results_2015.doc

The Australasian (iron & steel) Slag Association (ASA) conducts an annual survey for information regarding iron & steel slag (ISS) production and value added sold quantities by members and non-members for each calendar year. This report compiled during 2016 reports on industry members¹ and non-members ISS production, importation and sales for the calendar period 2015.

Information provided by members and non-members is reviewed, compared, collated and aggregated into a national set of results and include ISS production levels, and nominated uses for all slag products.

For the calendar period January to December 2015, some 2.496 million tonnes (Mt) ISS was generated by steel makers nationally or imported from overseas sources and used within various industry sectors. Compared with 2014, there was decrease of approximately 110,000 metric tonnes of total slag available within the market.

This decrease in volume of ISS correlates well with current depressed domestic demand for steel, in particular within the streams of steel production for BOS and EAF processes. Conversely the high demand for granulated blast furnace slag (GBFS) continues within the cement and concrete sectors again increasing some 40,000 tonnes over the period. For the reported period GBFS was from either domestic sources or imported mainly from Japan.

From the 2.496 Mt available, 2.57 Mt or 102% of ISS produced was effectively utilised within various value added civil and construction material applications throughout Australasia.

The survey results include all generators, (iron & steel plants) marketers, (processing and marketing companies) and users for the total production and resulting sales by each end use. Where required, data is supplemented with importation data² and other secondary data sources for accuracy purposes.

The key results for the calendar period 2015 survey were:

- Approximately 2.496 Mt (million tonnes) of iron and steel slag products were produced within Australasia (Australia and New Zealand).
- From the ISS produced, some 2.57 Mt or 102% has been effectively utilised [sold or reused for some beneficial use].
- On per capita basis, this equates to 127 kgs per person recycled or reused for 2015
- 65% or 1.67 Mt was used in cementitious applications - "high value add" [HVA]³ Note: approx 1 Mt of GBFS was imported.

² ABS [Austats] based on import tariff code for Granulated Blast Furnace Slag (GBFS).

³ HVA – High Value Add – means where ISS materials are sold for > (more than) \$100/tonne

Ed: 1	Australasian (iron & steel) Slag Association Incorporated	Page: 2 of 4
Date: June, 2016		ASA Membership Survey 2015

- 24% or 0.598 Mt was used in non-cementitious or road construction applications - medium value add [MVA]⁴.
- 12% or 0.295 Mt was in general civil or fill applications – low value add [LVA]⁵.

In summary the longer-term trend of ISS materials end use applications continues its movement towards HVA away from LVA applications. To this end, the active recovery and use of ISS continues to provide significant positive environmental impacts, including resource conservation and in this case, the reduction of greenhouse gas emissions from the processing of virgin resources.

Table 1 provides more detail for individual category sales of ISS for the period 2015 with comparisons against 2014, 2013, 2012, 2011, 2010, 2009 and 2008.

Australasian (iron & steel) Slag Association
June, 2016

⁴ MVA – Medium Value Add – means where ISS materials are sold for between \$10-\$100/tonne

⁵ LVA – Low Value Add – means where ISS materials are sold for < (less than) \$10/tonne
